ReplixFax Fax Server API Toolkits

The ReplixFax Fax Server offers a rich set of easy-to-use APIs to develop custom fax applications or fax-enable existing business applications.

Web Services API

The ReplixFax Web Services API allows our customers to easily add electronic fax capability to existing business applications or IT infrastructure. It follows the SOAP standard and supports our WSDL which allows for automated client-side code generation.

Windows API

The ReplixFax Windows Fax API supports standard Windows programming environment and provides an easy-to-use interface for custom fax application development or integration to the fax service from Visual Basic, C/C++ or any other programming or scripting language that supports COM objects.

Java API

The Java Fax API allows any Java application to easily integrate with the ReplixFax servers using the ReplixFax Java Class Libraries. The toolkit allows fax sending, monitoring fax status, server-based phonebook management, fax routing and inbound fax management among its capabilities.

Command Line API

The Command Line Fax API is a compact, server-based toolkit consisting of a set of ASCII commands that can be embedded into any host-based or client/server applications. The toolkit interfaces directly to the ReplixFax server to easily integrate fax server functionality into any host-based systems, and allows users to quickly fax enable host-based applications or develop ad-hoc fax server administration applications. The Command Line Fax API is available for ReplixFax for Solaris and Linux platforms.

Pre-and-Post Filters

The Pre-and-Post Filters are customer provided scripts or programs that are called by the ReplixFax server upon pre- or post-fax send/receive events such as upon fax receipt or before fax send. The scripts or custom written programs are easily configured through the server administration interface. This convenient hook into the ReplixFax server enables fast development of custom fax applications or ad-hoc fax processing.
